

MINI PROJECT ABSTRACT

Project Title: Interactive Geographical Heritage Map of India

Student Name & Roll Number: Manya Goel, 2400300100237

Guide Name: Ms. Disha

Abstract (250–300 words):

India possesses a vast and diverse cultural heritage, encompassing centuries of traditional arts, crafts, music, and GI-tagged products. However, conventional methods of showcasing this rich history—such as static textbooks or physical exhibits—often fail to engage modern digital audiences and lack multisensory interaction. To address problem statement 26197 (innovative ideas showcasing Indian traditions), this mini-project proposes the development of an "Interactive Geographical Heritage Map of India," a dynamic web-based application designed to digitize cultural exploration.

The core solution is an intuitive digital cartography platform where users can interact with a fully clickable map of India. Built utilizing standard web technologies (HTML5, CSS3, and Vanilla JavaScript) and powered by the open-source Leaflet.js mapping library, the platform renders state-specific geographical boundaries via GeoJSON data. Upon clicking a specific state, the user is presented with a visually appealing modal card detailing the region's unique cultural heritage, such as Kanjeevaram silk in Tamil Nadu or the Chhau dance in Eastern India. To elevate the user experience beyond a standard visual interface, the project integrates a native HTML5 Audio API, automatically triggering a localized 5-second snippet of traditional folk music corresponding to the selected state.

This lightweight, static web architecture ensures high performance, zero server-side maintenance costs, and seamless scalability for adding future cultural datasets. Ultimately, this interactive map serves as an accessible educational tool that bridges the gap between ancient Indian traditions and contemporary front-end web development, fulfilling the mandate to innovatively preserve and promote India's cultural legacy.
